(57) **ABSTRACT**

A computer receives data detailing operation of a plurality of at least partially manually operated automobiles. The computer determines one or more trends in the operation of the plurality of at least partially manually operated automobiles, based at least in part on the data detailing the operation of the plurality of manually operated vehicles. The computer generates one or more operational rules, based, at least in part, on the one or more trends. The computer transmits the one or more operational rules to one or more at least semi-autonomous vehicles.

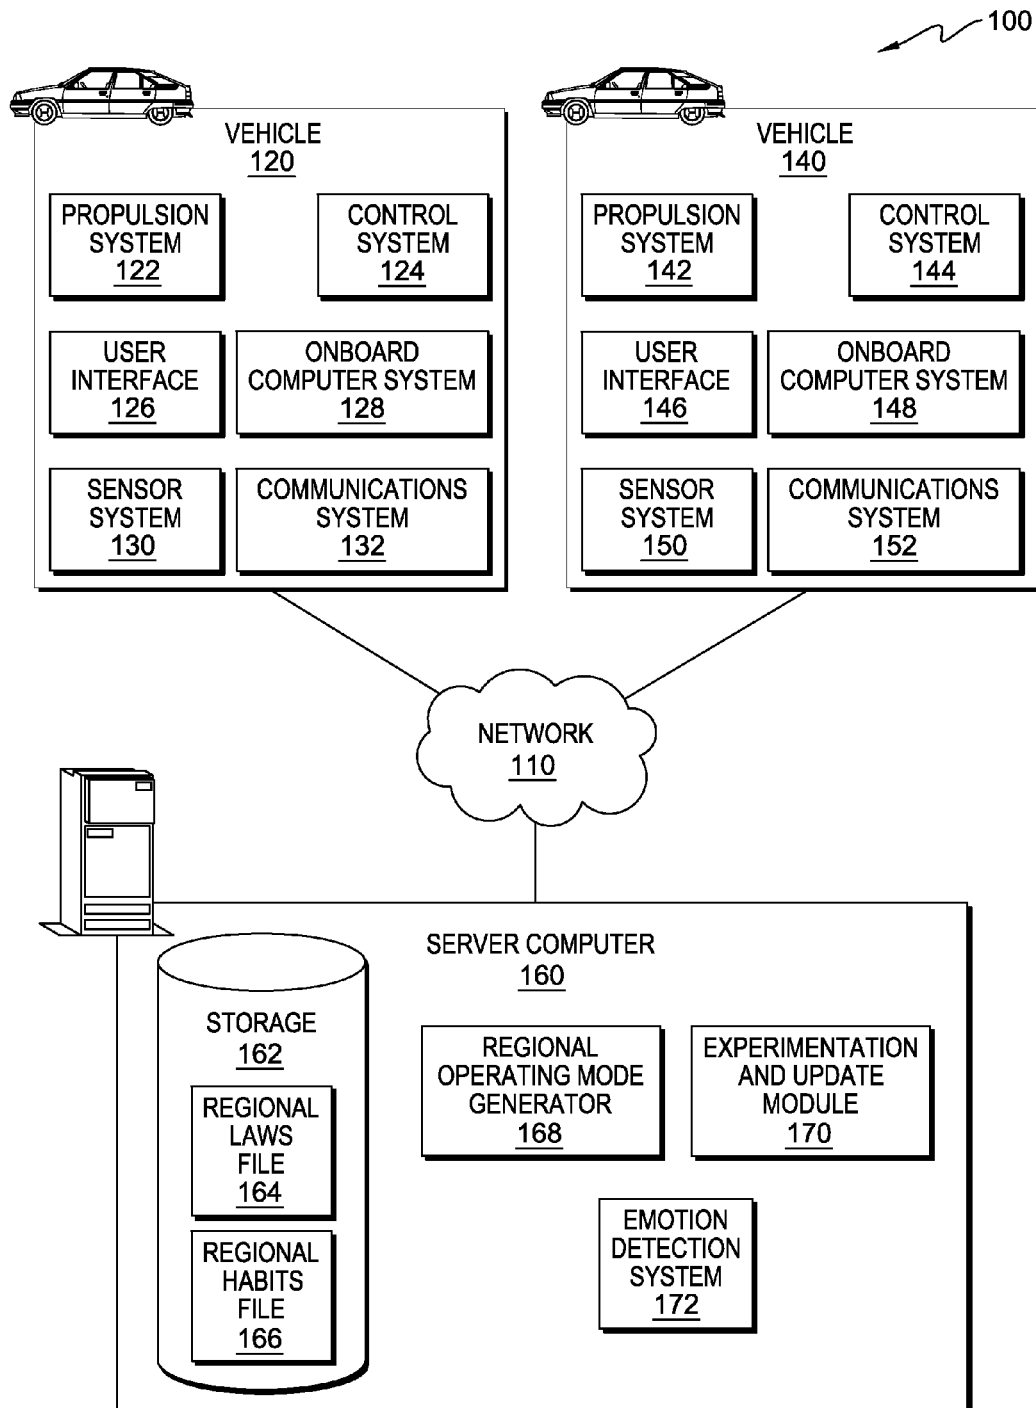

FIG. 1

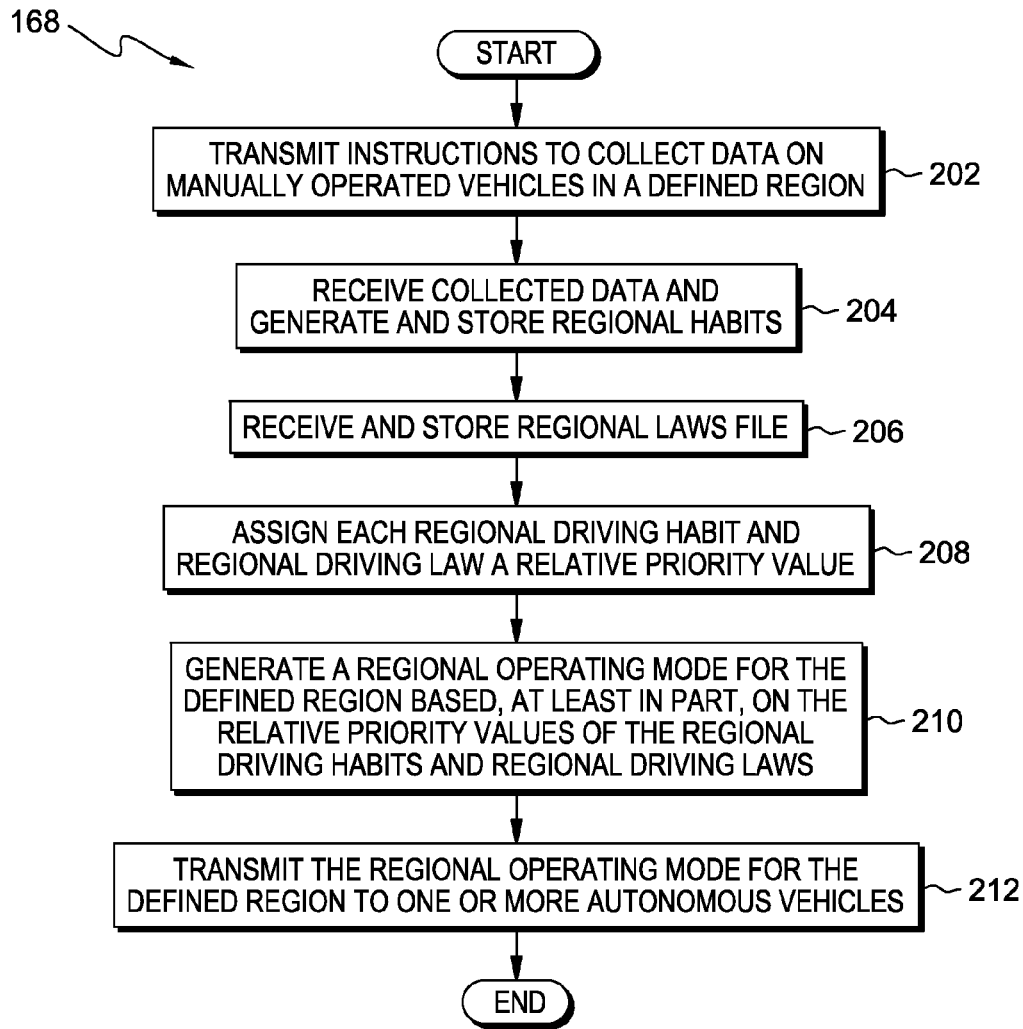

FIG. 2

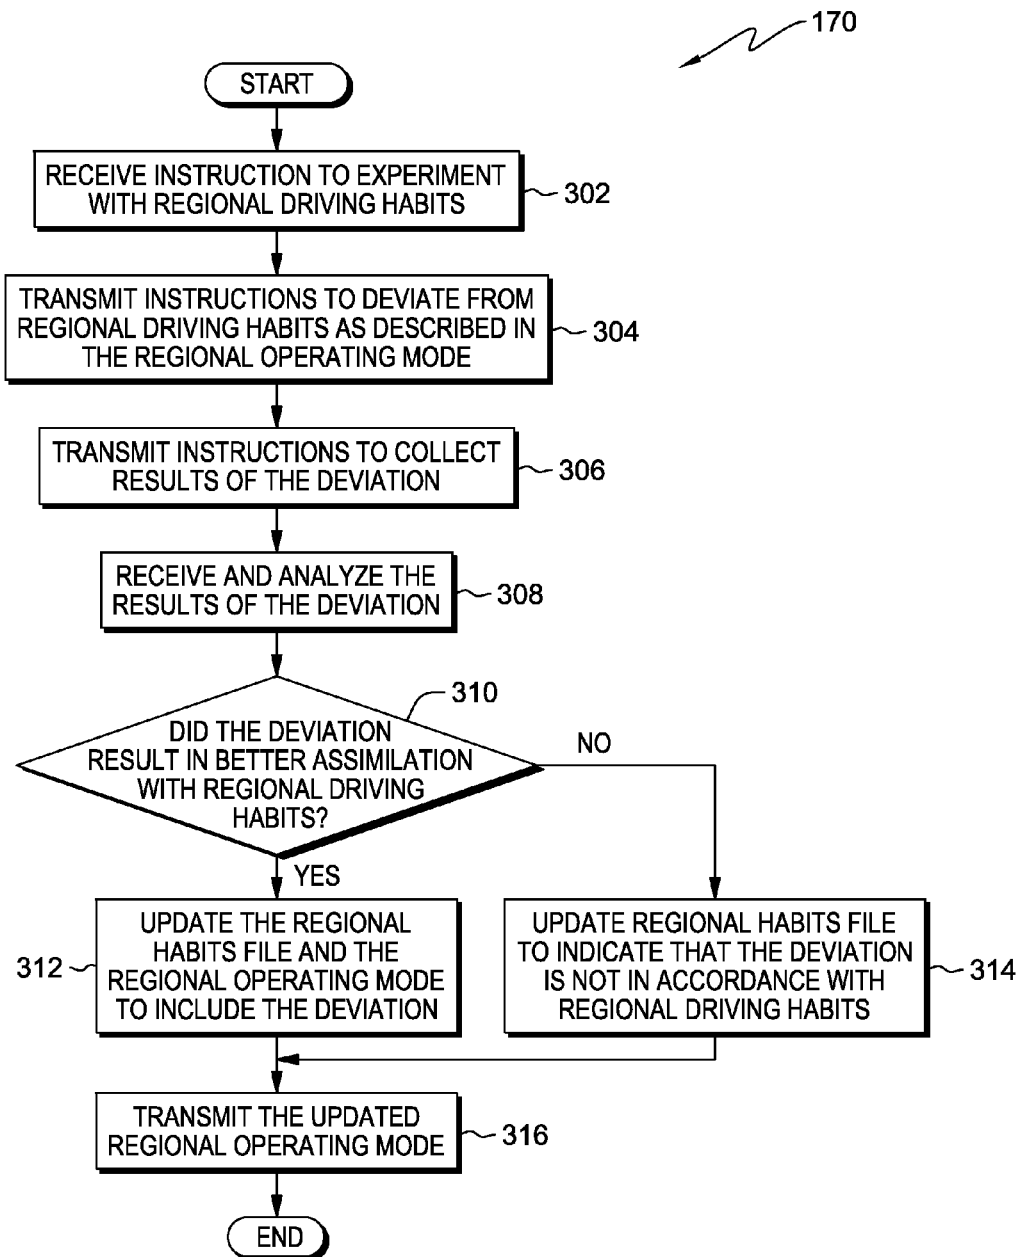

FIG. 3

FIG. 4

1

## REGIONAL OPERATION MODES FOR AUTONOMOUS VEHICLES

### FIELD OF THE INVENTION

The present invention relates generally to the field of autonomous vehicles, and more particularly to modifying the operation of autonomous vehicles based on geographic driving trends.

### BACKGROUND OF THE INVENTION

Autonomous vehicles are automobiles that have the ability to operate and navigate without human input. Autonomous vehicles use sensors, such as radar, LIDAR, global positioning systems, and computer vision to detect the vehicle's surroundings. Advanced computer control systems interpret the sensory input information to identify appropriate navigation paths, as well as obstacles and relevant signage. Some autonomous vehicles update map information in real time to remain aware of the vehicle's location even if conditions change or the vehicle enters an uncharted environment. Autonomous vehicles increasingly communicate with remote computer systems via wireless network connections and with one another using dedicated short range communications (DSRC).

Driving habits vary by region. For example, acceptable speeds in excess of the speed limit depend on the region and driving conditions, or amount of space left between cars traveling on a busy road. Many of these habits are learned behaviors, and other drivers in the region expect those cars around them to operate according to the regional standards.

### SUMMARY

A computer receives data detailing operation of a plurality of at least partially manually operated automobiles. The computer determines one or more trends in the operation of the plurality of at least partially manually operated automobiles, based at least in part on the data detailing the operation of the plurality of manually operated vehicles. The computer generates one or more operational rules, based, at least in part, on the one or more trends. The computer transmits the one or more operational rules to one or more at least semi-autonomous vehicles.

### BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWINGS

FIG. 1 is a functional block diagram illustrating an autonomous vehicle environment, in accordance with an embodiment of the present invention.

FIG. 2 is a flowchart depicting operational steps of a regional operating mode generator, operating on a server computer within the autonomous vehicle environment of FIG. 1, in accordance with an embodiment of the present invention.

FIG. 3 illustrates operational steps of an experimentation and update module, operating on a server computer within the autonomous vehicle environment of FIG. 1, in accordance with an embodiment of the present invention.

FIG. 4 depicts a block diagram of components of the server computer executing the regional operating mode generator and the experimentation and update module, in accordance with an embodiment of the present invention.

### DETAILED DESCRIPTION

Embodiments of the present invention recognize that regional driving habits pose a potential hazard to both drivers

2

and passengers as the number of autonomous vehicles operating on roadways increases. Drivers in a particular region expect those around them to abide by the regional driving norms, and deviation from the expected behaviors can cause unsafe conditions. For example, an autonomous vehicle that does not merge as expected can cause other automobiles in the immediate area to need to swerve or brake unexpectedly in order to avoid a collision, which in turn can lead to more unsafe behavior. As a result, embodiments of the present invention recognize that autonomous vehicles with the ability to adapt to regional driving preferences results in safer roadways for passengers in the autonomous vehicle and motorists operating nearby vehicles.

The present invention will now be described in detail with reference to the Figures. FIG. 1 is a functional block diagram illustrating an autonomous vehicle environment ("environment"), generally designated **100**, in accordance with an embodiment of the present invention. Environment **100** includes vehicles **120** and **140** and server computer **160**, all interconnected over network **110**. Network **110** can be, for example, a local area network (LAN), a wide area network (WAN), such as the Internet, a dedicated short range communications network, or any combination thereof, and may include wired, wireless, fiber optic, or any other connection known in the art. In general, the communication network can be any combination of connections and protocols that will support communication between vehicle **120**, vehicle **140**, and server computer **160**, in accordance with an embodiment of the present invention.

Vehicles **120** and **140** are motorized vehicles operating within a defined regional boundary. In various embodiments of the present invention, vehicles **120** and **140** can be autonomous, semi-autonomous, or manually operated, or a combination thereof. In one embodiment, vehicle **120** represents a plurality of autonomous vehicles operating within a defined regional boundary, and vehicle **140** represents a plurality of manually operated vehicles operating within the same regional boundary. In various embodiments, vehicles **120** and **140** include propulsion systems **122** and **142**, control systems **124** and **144**, user interfaces **126** and **146**, onboard computer systems **128** and **148**, sensor systems **130** and **150**, and communications systems **132** and **152**, respectively.

Propulsion systems **122** and **142** include components operable to provide powered motion to vehicles **120** and **140**, respectively. In various embodiments, propulsion systems **122** and **142** can include an engine/motor, an energy source, a transmission, and/or wheels/tires. The engine/motor can be any combination of an internal combustion engine, an electric motor, a steam engine, a Stirling engine, or other types of engines/motors. In some embodiments, propulsion systems **122** and **142** can include multiple types of engines and/or motors, such as, a gas-electric hybrid car. The energy source can be, for example, gasoline, diesel, other petroleum-based fuels, propane, other compressed gas-based fuels, ethanol, solar panels, and/or batteries. In various embodiments, the transmission can include a gearbox, clutch, differential, and drive shafts.

Control systems **124** and **144** are collections of mechanical, electro-mechanical, and electronic systems that can be configured to control the operations of vehicles **120** and **140**, respectively. In various embodiments, control systems **124** and **144** can each include a steering unit, a throttle, a brake unit, and/or a navigation system. In an embodiment, the steering unit can be a mechanism that can control the heading and/or turning of the vehicle. In one embodiment, the throttle can be configured to control the operating speed of the engine/motor and, in turn, the speed of the vehicle. In some embodi-

ments, the brake unit can include any combination of mechanisms configured to decelerate the vehicle. The brake unit can use, for example, friction to slow the rotation of the tires/wheels. In some embodiments, the brake unit converts kinetic energy of the wheels/tires into electrical current. In various embodiments, the navigation system can be any system configured to determine a driving path for the vehicle. In some embodiments, the navigation system receives input information from the GPS and camera systems included in sensor systems **130** or **150** in order to generate the driving path for the vehicle.

User interfaces **126** and **146** are mechanisms by which a passenger in vehicles **120** and **140**, respectively, can interact with the vehicle. User interfaces **126** and **146** can include, buttons, knobs, levers, pedals, paddles, and/or any other type of user interface, such as a touchscreen display capable of detecting the location and/or movement of a user's finger. The touchscreen can be, for example, a capacitive sensing screen, a resistance sensing screen, or a surface acoustic wave sensing screen.

Onboard computer systems **128** and **148** are computing systems, including at least one computer processor, that are capable of controlling one or more functions of vehicles **120** and **140**, respectively, based on inputs received from one or more of the systems included in the vehicle. For example, in an embodiment, onboard computer system **128** can control propulsion system **122** based on inputs received from sensor system **130**.

Sensor systems **130** and **150** include any number of sensors configured to detect information about vehicles **120** and **140**, respectively, and their surrounding environment. In various embodiments, sensor systems **130** and **150** can include a global positioning system (GPS), an inertial measurement unit (IMU), a RADAR unit, a LIDAR unit, and/or a camera. The GPS can be any sensor configured to estimate a geographic location. The IMU can be any combination of sensors configured to sense position and orientation changes in a vehicle based on inertial acceleration. The RADAR unit can be any system that uses radio signals to sense objects within the local environment of a vehicle. In various embodiments, the RADAR unit can also detect relative motion between the vehicle and the vehicle's surroundings. The LIDAR unit can be any system configured to sense objects in the vehicle's environment using one or more lasers. The camera can include one or more devices configured to capture a plurality of images of the environment of a vehicle. The camera can be a still or a video camera and may record visible and/or infrared light.

Communications systems **132** and **152** can be any system configured to communicate with one or more devices directly or via network **110**. In various embodiments, communications systems **132** and **152** can include a transmitter and a receiver for sending and receiving electromagnetic waves, respectively, such as an antenna.

Server computer **160** can be a desktop computer, a laptop computer, a tablet computer, a specialized computer server, a smartphone, or any other computer system known in the art. In certain embodiments, server computer **160** represents a computer system utilizing clustered computers and components that act as a single pool of seamless resources when accessed through network **110**, as is common in data centers and with cloud computing applications. In general, server computer **160** is representative of any programmable electronic device or combination of programmable electronic devices capable of executing machine-readable program instructions and communicating with other computing devices via a network. Exemplary components of server com-

puter **160** are described in greater detail with regard to FIG. **4**. Server computer **160** includes storage **162**, regional operating mode generator **168**, experimentation and update module **170**, and emotion detection system **172**. Storage **162** includes regional laws file **164** and regional habits file **166**.

Storage **162** is a computer readable storage device that maintains information detailing regional traffic laws and regional driving habits. In various embodiments, storage **162** can be a portable computer diskette, a hard disk, a random access memory (RAM), a read-only memory (ROM), an erasable programmable read-only memory (EPROM or Flash memory), a static random access memory (SRAM), a portable compact disc read-only memory (CD-ROM), a digital versatile disk (DVD), a memory stick, a floppy disk, a mechanically encoded device, such as punch-cards or raised structures in a groove having instructions recorded thereon, and any suitable combination of the foregoing. A computer readable storage medium, as used herein, is not to be construed as being transitory signals per se, such as radio waves or other freely propagating electromagnetic waves, electromagnetic waves propagating through a waveguide or other transmission media (e.g., light pulses passing through a fiber-optic cable), or electrical signals transmitted through a wire.

Regional laws file **164** is a collection of information describing various traffic laws for one or more driving regions. Regional laws file can include information on, for example, state and local traffic laws, including speed limits, passing rules, ability to turn at a red light, and yielding right of way. In one embodiment, regional laws file **164** includes a database that comprises a set of regional laws and a set of defined regions, wherein the database indicates which laws apply in which regions, as in a two-dimensional table or array. In one embodiment, server computer **160** may periodically update regional laws file **164** via network **110**.

Regional habits file **166** is a collection of information describing various regional traffic habits that characterize drivers in that region but are not explicitly detailed in regional laws file **164**. Regional habits file **166** can include, for example, regional habits, such as how multi-way stop signs are handled, regionally acceptable deviations from the speed limit, passing etiquette, aggressiveness when merging, distance between cars, turn signal timing, use of turn signals, stopping habits, accelerating habits, turning habits, response to emergency vehicles, and customs relating to yielding right of way. In general, regional habits file **166** can include any information that describes how drivers in a region behave in certain situations. In various embodiments, regional habits file **166** can be a database that includes a set of regional driving habits and a set of defined regions, wherein the database indicates to which regions a particular driving habit applies, as in a two-dimensional table or array. In one embodiment, server computer **160** may periodically update regional habits file **166** via network **110**.

Regional operating mode generator **168** is software residing on server computer **160** that instructs vehicle sensors, such as sensor system **130** on vehicle **120**, to collect data on manually operated vehicles in a defined region, and synthesizes the data with regional driving laws in order to generate a regional operating mode for the defined region. Regional operating mode generator **168** transmits the regional operating mode to autonomous vehicles, which can then be used in combination with propulsion system **122**, control system **124**, and onboard computer system **128** to control the behavior of vehicle **120** so that vehicle **120** operates with substantially similar behavior to manually operated vehicles in the region. In various embodiments, a region can be any geographic area

in which drivers exhibit similar driving habits. For example, a region can be as large as several states or as small as a single street or neighborhood.

Experimentation and update module **170** is software residing on server computer **160** that generates experimental changes to a regional operating mode and transmits instructions to one or more autonomous vehicles, such as vehicle **120**, and change the regional driving mode according to the generated change. Experimentation and update module **170** collects data on the results of the generated experimental changes and updates the regional operating mode according to the results.

Emotion detection system **172** is an example system of hardware and software components that collect data on the results of generated experimental changes and transmits the data to experimentation and update module **170** for analysis. In an example embodiment, emotion detection system **172** includes one or more cameras that focus on the facial expressions of an operator of a manually operated vehicle. In the example embodiment, the camera captures images of the operator's facial expression and feeds the image to facial analysis software included in emotion detection system **172** that analyzes the image to determine if the experimental change in regional driving mode elicited a positive or negative response from manually operated vehicle drivers. In other embodiments, emotion detection system **172** can include one or more microphones configured to detect the sounding of an automobile horn.

FIG. 2 is a flowchart depicting operational steps of regional operating mode generator **168**, in accordance with an embodiment of the present invention.

Regional operating mode generator **168** transmits instructions to collect data on manually operated vehicles in a defined region (step **202**). In an embodiment, regional operating mode **168** transmits instructions to onboard computing system **128** via network **110** to observe manually operated vehicles near vehicle **120** using one or more sensors included in sensor system **130**. For example, regional operating mode generator **168** can instruct vehicle **120** to collect speed information on manually operated vehicles in the region using sensor system **130**. Vehicle **120** can use an on board RADAR or LIDAR system to determine the speed of manually operated vehicles near vehicle **120**. In another embodiment, vehicle **120** uses an onboard camera system to determine the distance between manually operated vehicles. In another embodiment, sensor system **130** works in conjunction with control system **124** to collect data on manually operated vehicles in the defined region. For example, a camera system in sensor system **130** can determine that a manually operated vehicle is merging into the same lane as vehicle **120** within a determined distance which is below a threshold and then apply the brakes in control system **124** above a certain threshold. Based on this sequence of events, sensor system can transmit the information to onboard computer system **128** for integration with regional habits file **166**. This example is useful in determining the aggressiveness that drivers exhibit when merging in the defined region. In some embodiments, the regional operating mode generator **168** can send the instructions to multiple autonomous vehicles operating in the same region.

Regional operating mode generator **168** receives the collected data and then generates and stores regional habits based, at least in part, on the collected data (step **204**). In various embodiments, onboard computer system **128** transmits the collected data to server computer **160** via network **110**. In an embodiment, server computer **160** analyzes the data to generate regional driving habits. The analysis used to

create a regional driving habit can vary depending on the driving habit being analyzed. For example, some habits, such as speed and timing of turn signal usage, may include an average of all of the data collected for that driving trend. Other types of analysis can be more sophisticated, such as, taking into account the type of vehicle being observed (make and model), the registration of the vehicle (inside the defined region or outside of it), and/or environmental factors (e.g., traffic density, weather factors, time or day, etc.). In various embodiments, the regional habit created during the analysis can be stored in a single database file such as regional laws file **164** in storage **162**.

In an alternative embodiment, onboard computer system **128** can analyze raw data generated by observing manually operated vehicles in order to generate a regional driving habit (e.g., a mean or median value for a particular driving characteristic). For example, onboard computer system **128** can calculate the average speed over the posted speed limit at which drivers in the region travel. Server computer **160** can receive the driving habit value from vehicle **120** and incorporate one or more driving habits into a regional habits file, such as regional habits file **166**.

Regional operating mode generator **168** receives and stores regional laws file **164** for the defined region (step **206**). In various embodiments, regional laws file **164** is a collection of regional laws for the defined region. Regional laws file **164** can be generated based on state and local laws available on, for example, the Internet. In some embodiments, regional laws file **164** can be generated by state officials, local officials, law enforcement officials, insurance agencies, or any other entity capable of accessing the regional traffic laws and distilling them into a set of distinct rules for operating a vehicle in the defined region. In some embodiments, vehicles **120** and **140** can supplement regional laws by, for example, recognizing traffic signs such as speed limit signs and associating the speed limit with the specific location of the sign which can be determined, for example, with a GPS device or camera.

Regional operating mode generator **168** assigns each regional driving habit and each regional driving law for the defined region a relative priority value (step **208**). Priority values indicate the relative importance of a regional driving habit compared to other habits, as well as regional laws. In some embodiments, each regional driving habit and each regional law can be assigned a number, wherein the numbers indicate the precedence of the habit or law to which it is assigned. For example, habits and laws with a priority value of one can indicate those habits and laws the disobedience of which can create extremely unsafe driving conditions in the region, or are nearly non-existent in the region. On the other hand, a priority value of five can indicate those regional habits and laws which are necessary for safety considerations or are very prevalent in a region. For example, if a regional law indicates a speed limit of sixty (60) miles per hour, but the regional habit is to exceed the speed limit by five miles per hour (i.e., drive 65 miles per hour), then the speed limit law can receive a priority value of two (2), indicating relatively low priority, while the regional habit of exceeding the speed limit by five miles per hour can receive a priority value of five (5), indicating the prevalence of the habit in the region. In various embodiments, the determination of relative priority values can be based on a number of factors including, but not limited to, statistical factors (e.g., spread of the data and standard deviation of the data) and external data (e.g., the number of speeding tickets issued in a defined region for exceeding the speed limit by a given amount).

Regional operating mode generator **168** generates a regional operating mode based, at least in part, on the relative

priority values of the regional driving habits and regional driving laws (step 210). The regional operating mode is a complete set of driving instructions which indicate how vehicles 120 and 140 should operate in a defined region. In various embodiments, the regional operating mode can include a set of regional laws and regional habits that indicate how autonomous vehicles operate in the defined region. In some embodiments, the regional operating mode includes instructions for the control of propulsion system 122 and control system 124, based on inputs received from sensor system 130. For example, if sensor system 130 determines that the posted speed limit in the immediate area is 55 miles per hour, the weather is fair, the road conditions are dry, and that the regional operating mode indicates that, in order to maintain a safe operating environment, automated vehicle 120 should exceed the posted speed limit by five miles per hour in the defined region with good driving conditions, then onboard computer system 128 instructs propulsion system to accelerate to 60 miles per hour.

In various embodiments, the regional operating mode can include a set of variables, wherein each variable represents a driving characteristic that is numerically measurable using the various sensors included in sensor system 130. Examples of variables that can be included in the set are speed, turn signal timing, distance between cars at various speeds, etc. The numerical values associated with the variables can be manipulated to alter the behavior of vehicle 120 in different regions.

Regional operating mode generator 168 transmits the regional operating mode to one or more autonomous vehicles operating in or near the defined region (step 212). In various embodiments, regional operating mode generator transmits the regional operating mode to onboard computing systems of one or more autonomous vehicles via network 110. In some embodiments, the regional operating mode is stored in a local memory on the autonomous vehicle, which may be included in onboard computer system 128. In some embodiments, transmission of the regional operating mode can be based on the GPS coordinates of the autonomous vehicle. For example, when an autonomous vehicle enters a certain radius around the region (e.g., fifty miles), then the autonomous vehicle can transmit a request for an updated set of regional operating modes for nearby regions. Responsive to this request, regional operating mode generator 168 can send the regional operating mode for all regions that are at least partially within fifty miles of the autonomous vehicle.

FIG. 3 illustrates operational steps of experimentation and update module 170, operating on a server computer within the environment of FIG. 1, in accordance with an embodiment of the present invention. Experimentation and update module 170 enables server computer 160 to perform automated refining of the regional operating mode created by regional operating mode generator 168. Initially, server computer 160 creates a regional operating mode and transmits the regional operating mode to one or more automated vehicles, for example, by performing the steps of regional operating mode generator 168, as described in FIG. 2.

Experimentation and update module 170 receives an instruction to experiment with regional driving habits (step 302). Experimentation with the regional driving habits is a mechanism to maintain up to date information on regional driving habits, as well as to refine existing regional driving habits by increasing the data pool from which the regional operating mode is determined. The instruction to experiment can be initiated by, for example, a passenger in an autonomous vehicle, an external computer system connected to server computer 160 via network 110, or periodic initializa-

tion of experimentation built into the functionality of experimentation and update module 170. Experimentation and update module 170 collects additional data in order to create a more refined regional operating mode and to capture changes in regional driving habits that occur over time. In various embodiments, a passenger can input the instruction to experiment to experimentation and update module 170 by entering a command through user interface 126. Onboard computer system 128 can then transmit the instruction to server computer 160 via network 110. In other embodiments, experimentation and update module 170 may include program instructions to run at regular intervals of time and may, therefore, initiate itself to experiment with regional driving habits.

Experimentation and update module 170 transmits instructions to onboard computer system 128 to instruct vehicle 120 to deviate from regional driving habits, as described in the regional operating mode (step 304). In an embodiment, the instruction to deviate includes a specific habit with which to experiment (e.g., speeding, merging, use of turn signal, etc.). In various embodiments, the level or amount of deviation can be included in order to both provide useful results and in order to maintain the safety of passengers and drivers. For example, the amount of deviation may be based on a statistical analysis, such as standard deviation, or based on defined limits, such as, not exceeding the speed limit by more than ten miles per hour regardless of what the standard deviation is. In other embodiments, where the number of possible behaviors is limited, the experimental behavior may be selected from a list of possible behaviors. For example, when encountering a red light at an intersection where vehicle intends to make a right hand turn, only two possible options exist: "turn right on red" and "wait until the light is green before turning." In this example, the number of possible behaviors is limited and, therefore, no additional statistical analysis is needed. Computing system 128 can choose the behavior that is the opposite of the previously determined regional habit for this particular situation.

Experimentation and update module 170 transmits instructions to collect results of the deviation (step 306). In various embodiments, experimentation and update module 170 transmits instructions to vehicle 120 via network 110 to collect data on the reaction of the deviation and transmit the data back to server computer 160. In various embodiments, vehicle 120 can use any of the sensors included in sensor system 130 to collect data that indicates the reaction of manually operated vehicles in the region to the deviation in behavior. In an embodiment, vehicle 120 can use a RADAR or LIDAR system to detect a manually operating vehicle braking sharply in response to the deviation. In another embodiment, sensor system 130 can include a microphone that is capable of detecting a car horn. In some embodiments, sensor system 130 includes a camera that can take pictures of the facial expression(s) of drivers of manually operated vehicles for analysis by facial recognition software, such as emotion detection system 172. In an embodiment, the manually operated vehicle includes a camera system and/or other physiological detection systems, such as, heart rate monitors and pressure sensors in the steering wheel to detect changes in grip strength for detecting reactions to deviations. In this embodiment, the manually operated vehicle, such as vehicle 140 connects to vehicle 120 and/or server computer 160, and can transmit the result of local reaction tests for analysis by experimentation and update module 170. In this embodiment, vehicle 120 collects data from nearby vehicles in the region regarding the effect of a particular deviation from the regional operating mode on drivers of manually operated vehicles.

Experimentation and update module **170** receives and analyzes the results of the deviation (step **308**). Experimentation and update module **170** performs an analysis of the data received following the deviation from the regional operating mode with the goal of determining if the deviation elicited positive reactions from drivers of manually operated vehicles and can be used to refine the regional operating mode to better describe regional driving habits. In various embodiments, analyzing the results of the data collected on a particular deviation can include detecting whether a driver honked a horn in response to the deviation, or whether a RADAR or LIDAR unit detected a sharp braking, acceleration, or swerving action in a manually operated vehicle.

In an embodiment where vehicle **120** or the manually operated vehicle collected images of the driver's and/or passenger's facial expressions, the images can undergo further analysis in order to determine whether the reaction was positive or not. As one skilled in the art will recognize, various mechanisms for analyzing facial expressions exist. In some embodiments, emotion detection system **172** can be a program designed to detect emotions based on facial expressions. For example, emotion detection system **172** can analyze images of facial expressions to detect such emotions as joy, fear, shock, surprise, and/or anger. In some embodiments, certain emotions can be associated with different results of the analysis of the deviation data. For example, emotions such as surprise, anger, and fear may be considered negative reactions while emotions such as joy can be considered positive reactions.

Experimentation and update module **170** determines whether the deviation resulted in better assimilation with regional driving habits (decision block **310**). In various embodiments, experimentation and update module **170** determines that positive and/or neutral reactions from drivers in response to a deviation indicates that the behavior in the deviation is consistent with regional driving habits and may, therefore, be included in the regional operating mode. On the other hand, experimentation and update module **170** can determine that negative reactions from drivers and extreme or unexpected reactions in driving style of manually operated vehicles indicate that the deviation was not consistent with regional driving habits. If experimentation and update module **170** determines that the deviation resulted in better assimilation with regional driving habits (decision block **310**, YES branch), then experimentation and update module **170** updates regional habits file **166** and the regional operating mode to include the deviation behavior in step **312**. In one embodiment, updating regional habits file **166** can include replacing information detailing regional driving habit with new information detailing the same or a different habit. In another embodiment, updating regional habits file **166** can comprise changing the priority value associated with an existing regional driving habit.

If experimentation and update program **170** determines that the deviation did not result in better assimilation with regional driving habits (decision block **310**, NO branch), then experimentation and update module **170** updates regional habits file **166** and the regional operating mode to indicate that the deviation is not in accordance with regional driving habits in step **314**. In an embodiment, indicating that the deviation is not in accordance with regional driving habits can include updating one or more priority values associated with one or more regional driving habits included in regional habits file **166**. In some embodiments, experimentation and update module **170** can also maintain a list of deviations that have been attempted so that similar deviations do not repeat more than once in a short period of time.

Experimentation and update module **170** transmits the updated regional operating mode to one or more autonomous vehicles operating in or near the defined region (step **316**). In various embodiments, experimentation can disseminate the updated regional operating mode to one or more autonomous vehicles operating in or around the defined region via network **110**.

FIG. **4** depicts a block diagram of components of server computer **160**, in accordance with an illustrative embodiment of the present invention. It should be appreciated that FIG. **4** provides only an illustration of one implementation, and does not imply any limitations with regard to the environments in which different embodiments may be implemented. Many modifications to the depicted environment may be made.

Server computer **160** includes communications fabric **402**, which provides communications between computer processor(s) **404**, memory **406**, persistent storage **408**, communications unit **410**, and input/output (I/O) interface(s) **412**. Communications fabric **402** can be implemented with any architecture designed for passing data and/or control information between processors (such as microprocessors, communications and network processors, etc.), system memory, peripheral devices, and any other hardware components within a system. For example, communications fabric **402** can be implemented with one or more buses.

Memory **406** and persistent storage **408** are computer-readable storage media. In this embodiment, memory **406** includes random access memory (RAM) **414** and cache memory **416**. In general, memory **406** can include any suitable volatile or non-volatile computer-readable storage media.

Regional operating mode generator **168** and experimentation and update module **170** are stored in persistent storage **408** for execution by one or more of the respective computer processors **404** via one or more memories of memory **406**. In this embodiment, persistent storage **408** includes a magnetic hard disk drive. Alternatively, or in addition to a magnetic hard disk drive, persistent storage **408** can include a solid state hard drive, a semiconductor storage device, read-only memory (ROM), erasable programmable read-only memory (EPROM), flash memory, or any other computer-readable storage media that is capable of storing program instructions or digital information.

The media used by persistent storage **408** may also be removable. For example, a removable hard drive may be used for persistent storage **408**. Other examples include optical and magnetic disks, thumb drives, and smart cards that are inserted into a drive for transfer onto another computer-readable storage medium that is also part of persistent storage **408**.

Communications unit **410**, in these examples, provides for communications with other data processing systems or devices, including resources of vehicles **120** and **140**. In these examples, communications unit **410** includes one or more network interface cards. Communications unit **410** may provide communications through the use of either or both physical and wireless communications links. Regional operating mode generator **168** and experimentation and update module **170** may be downloaded to persistent storage **408** through communications unit **410**.

I/O interface(s) **412** allows for input and output of data with other devices that may be connected to server computer **160**. For example, I/O interface **412** may provide a connection to external devices **418** such as a keyboard, keypad, a touch screen, and/or some other suitable input device. External devices **418** can also include portable computer-readable storage media such as, for example, thumb drives, portable optical or magnetic disks, and memory cards. Software and

data used to practice embodiments of the present invention, e.g., regional operating mode generator **168** and experimentation and update module **170**, can be stored on such portable computer-readable storage media and can be loaded onto persistent storage **408** via I/O interface(s) **412**. I/O interface(s) **412** also connect to a display **420**.

Display **420** provides a mechanism to display data to a user and may be, for example, a computer monitor.

The programs described herein are identified based upon the application for which they are implemented in a specific embodiment of the invention. However, it should be appreciated that any particular program nomenclature herein is used merely for convenience, and thus the invention should not be limited to use solely in any specific application identified and/or implied by such nomenclature.

The flowchart and block diagrams in the Figures illustrate the architecture, functionality, and operation of possible implementations of systems, methods, and computer program products according to various embodiments of the present invention. In this regard, each block in the flowchart or block diagrams may represent a module, segment, or portion of code, which comprises one or more executable instructions for implementing the specified logical function(s). It should also be noted that, in some alternative implementations, the functions noted in the block may occur out of the order noted in the figures. For example, two blocks shown in succession may, in fact, be executed substantially concurrently, or the blocks may sometimes be executed in the reverse order, depending upon the functionality involved. It will also be noted that each block of the block diagrams and/or flowchart illustration, and combinations of blocks in the block diagrams and/or flowchart illustration, can be implemented by special purpose hardware-based systems that perform the specified functions or acts, or combinations of special purpose hardware and computer instructions. The present invention may be a system, a method, and/or a computer program product. The computer program product may include a computer readable storage medium (or media) having computer readable program instructions thereon for causing a processor to carry out aspects of the present invention.

The computer readable storage medium can be a tangible device that can retain and store instructions for use by an instruction execution device. The computer readable storage medium may be, for example, but is not limited to, an electronic storage device, a magnetic storage device, an optical storage device, an electromagnetic storage device, a semiconductor storage device, or any suitable combination of the foregoing. A non-exhaustive list of more specific examples of the computer readable storage medium includes the following: a portable computer diskette, a hard disk, a random access memory (RAM), a read-only memory (ROM), an erasable programmable read-only memory (EPROM or Flash memory), a static random access memory (SRAM), a portable compact disc read-only memory (CD-ROM), a digital versatile disk (DVD), a memory stick, a floppy disk, a mechanically encoded device such as punch-cards or raised structures in a groove having instructions recorded thereon, and any suitable combination of the foregoing. A computer readable storage medium, as used herein, is not to be construed as being transitory signals per se, such as radio waves or other freely propagating electromagnetic waves, electromagnetic waves propagating through a waveguide or other transmission media (e.g., light pulses passing through a fiber-optic cable), or electrical signals transmitted through a wire.

Computer readable program instructions described herein can be downloaded to respective computing/processing devices from a computer readable storage medium or to an

external computer or external storage device via a network, for example, the Internet, a local area network (LAN), a wide area network (WAN), and/or a wireless network. The network may comprise copper transmission cables, optical transmission fibers, wireless transmission, routers, firewalls, switches, gateway computers and/or edge servers. A network adapter card or network interface in each computing/processing device receives computer readable program instructions from the network and forwards the computer readable program instructions for storage in a computer readable storage medium within the respective computing/processing device.

Computer readable program instructions for carrying out operations of the present invention may be assembler instructions, instruction-set-architecture (ISA) instructions, machine instructions, machine dependent instructions, microcode, firmware instructions, state-setting data, or either source code or object code written in any combination of one or more programming languages, including an object oriented programming language such as, Smalltalk, C++ or the like, and conventional procedural programming languages, such as the "C" programming language or similar programming languages. The computer readable program instructions may execute entirely on the user's computer, partly on the user's computer, as a stand-alone software package, partly on the user's computer and partly on a remote computer, or entirely on the remote computer or server. In the latter scenario, the remote computer may be connected to the user's computer through any type of network, including a local area network (LAN) or a wide area network (WAN), or the connection may be made to an external computer (for example, through the Internet using an Internet Service Provider). In some embodiments, electronic circuitry including, for example, programmable logic circuitry, field-programmable gate arrays (FPGA), or programmable logic arrays (PLA) may execute the computer readable program instructions by utilizing state information of the computer readable program instructions to personalize the electronic circuitry, in order to perform aspects of the present invention.

Aspects of the present invention are described herein with reference to flowchart illustrations and/or block diagrams of methods, apparatus (systems), and computer program products according to embodiments of the invention. It will be understood that each block of the flowchart illustrations and/or block diagrams, and combinations of blocks in the flowchart illustrations and/or block diagrams, can be implemented by computer readable program instructions.

These computer readable program instructions may be provided to a processor of a general purpose computer, special purpose computer, or other programmable data processing apparatus to produce a machine, such that the instructions, which execute via the processor of the computer or other programmable data processing apparatus, create means for implementing the functions/acts specified in the flowchart and/or block diagram block or blocks. These computer readable program instructions may also be stored in a computer readable storage medium that can direct a computer, a programmable data processing apparatus, and/or other devices to function in a particular manner, such that the computer readable storage medium having instructions stored therein comprises an article of manufacture including instructions which implement aspects of the function/act specified in the flowchart and/or block diagram block or blocks.

The computer readable program instructions may also be loaded onto a computer, other programmable data processing apparatus, or other device to cause a series of operational steps to be performed on the computer, other programmable apparatus or other device to produce a computer implemented

## 13

process, such that the instructions which execute on the computer, other programmable apparatus, or other device implement the functions/acts specified in the flowchart and/or block diagram block or blocks.

The flowchart and block diagrams in the Figures illustrate the architecture, functionality, and operation of possible implementations of systems, methods, and computer program products according to various embodiments of the present invention. In this regard, each block in the flowchart or block diagrams may represent a module, segment, or portion of instructions, which comprises one or more executable instructions for implementing the specified logical function(s). In some alternative implementations, the functions noted in the block may occur out of the order noted in the figures. For example, two blocks shown in succession may, in fact, be executed substantially concurrently, or the blocks may sometimes be executed in the reverse order, depending upon the functionality involved. It will also be noted that each block of the block diagrams and/or flowchart illustration, and combinations of blocks in the block diagrams and/or flowchart illustration, can be implemented by special purpose hardware-based systems that perform the specified functions or acts or carry out combinations of special purpose hardware and computer instructions.

What is claimed is:

1. A method comprising:  
by program instructions on a computing device,  
receiving data detailing operation of a plurality of at least partially manually operated automobiles;  
determining one or more trends in the operation of the plurality of at least partially manually operated automobiles, based at least in part on the data detailing the operation of the plurality of manually operated vehicles;  
generating one or more operational rules that are valid for a first geographic area, based, at least in part, on the one or more trends; and  
transmitting the one or more operational rules to one or more at least semi-autonomous vehicles.
2. The method of claim 1, further comprising:  
transmitting a first set of information to the one or more at least semi-autonomous vehicles, wherein the first set of information instructs the one or more semi-autonomous vehicles to deviate from at least one of the one or more operational rules;  
receiving data detailing one or more reactions of one or more operators of a second plurality of at least partially manually operated vehicles operating within the first geographic area; and  
updating at least one of the one or more operational rules, based at least in part on the data detailing the one or more reactions.
3. The method of claim 2, wherein collecting data detailing one or more reactions comprises:  
detecting one or more images of a facial expression; and  
analyzing the one or more images of the facial expression to determine an operator response, wherein the analysis comprises performing facial expression recognition to determine a sentiment associated with the operator response.
4. The method of claim 3, further comprising:  
responsive to determining that the sentiment associated with the operator response is positive, updating the one or more operational rules to reflect the positive operator response to the deviation from the at least one of the one or more operational rules.

## 14

5. The method of claim 4, further comprising:  
responsive to determining that the sentiment associated with the operator response is neutral, updating, by one or more computer processors, the one or more operational rules to reflect the neutral operator response to the deviation from the at least one of the one or more operational rules as if the operator response was positive.
6. The method of claim 3, further comprising:  
responsive to determining that the driver response is negative, updating the one or more operational rules to reflect the negative operator response to the deviation from the at least one of the one or more operational rules.
7. The method of claim 6, wherein determining that the driver response is negative includes determining the sentiment associated with the operator response includes at least one of fear, shock, surprise, and anger.
8. The method of claim 1, wherein generating the one or more operational rules comprises:  
assigning a first set of one or more priority values to the one or more trends;  
assigning a second set of one or more priority values to one or more traffic laws; and  
determining the one or more operational rules, based at least in part on the first set of one or more priority values and the second set of one or more priority values.
9. The method of claim 8, further comprising:  
updating the first set of one or more priority values based at least in part on determining that a sentiment associated with an operator response is positive.
10. A computer program product comprising:  
one or more computer-readable storage media and program instructions stored on the one or more computer-readable storage media, wherein the one or more computer-readable storage media is not a signal, the program instructions comprising:  
program instructions to receive data detailing operation of a plurality of at least partially manually operated automobiles;  
program instructions to determine one or more trends in the operation of the plurality of at least partially manually operated automobiles, based at least in part on the data detailing the operation of the plurality of manually operated vehicles;  
program instructions to generate one or more operational rules that are valid for a first geographic area, based, at least in part, on the one or more trends; and  
program instructions to transmit the one or more operational rules to one or more at least semi-autonomous vehicles.
11. The computer program product of claim 10, wherein the program instructions further comprise:  
program instructions to transmit a first set of information to the one or more at least semi-autonomous vehicles, wherein the first set of information instructs the one or more semi-autonomous vehicles to deviate from at least one of the one or more operational rules;  
program instructions to receive data detailing one or more reactions of one or more operators of a second plurality of at least partially manually operated vehicles operating within the first geographic area; and  
program instructions to update at least one of the one or more operational rules, based at least in part on the data detailing the one or more reactions.
12. The computer program product of claim 11, wherein the program instructions to collect data detailing one or more reactions comprises:

## 15

program instructions to detect one or more images of a facial expression; and  
 program instructions to analyze the one or more images of the facial expression to determine an operator response, wherein the analysis comprises performing facial expression recognition to determine a sentiment associated with the operator response.

13. The computer program product of claim 12, wherein the program instructions further comprise:

responsive to determining that the sentiment associated with the operator response is positive, program instructions to update the one or more operational rules to reflect the positive operator response to the deviation from the at least one of the one or more operational rules.

14. The computer program product of claim 12, wherein the program instructions further comprise:

responsive to determining that the driver response is negative, program instructions to update the one or more operational rules to reflect the negative operator response to the deviation from the at least one of the one or more operational rules.

15. The computer program product of claim 12, wherein the program instructions to generate the one or more operational rules comprises:

program instructions to assign a first set of one or more priority values to the one or more trends;  
 program instructions to assign a second set of one or more priority values to one or more traffic laws; and  
 program instructions to determine the one or more operational rules, based at least in part on the first set of one or more priority values and the second set of one or more priority values.

16. A computer system comprising:

one or more computer processors;  
 one or more computer-readable storage media, wherein the one or more computer-readable storage media is not a signal;  
 program instructions stored on the computer-readable storage media for execution by at least one of the one or more processors, the program instructions comprising:  
 program instructions to receive data detailing operation of a plurality of at least partially manually operated automobiles;  
 program instructions to determine one or more trends in the operation of the plurality of at least partially manually operated automobiles, based at least in part on the data detailing the operation of the plurality of manually operated vehicles;

## 16

program instructions to generate one or more operational rules that are valid for a first geographic area, based, at least in part, on the one or more trends; and

program instructions to transmit the one or more operational rules to one or more at least semi-autonomous vehicles.

17. The computer system of claim 16, wherein the program instructions further comprise:

program instructions to transmit a first set of information to the one or more at least semi-autonomous vehicles, wherein the first set of information instructs the one or more semi-autonomous vehicles to deviate from at least one of the one or more operational rules;

program instructions to receive data detailing one or more reactions of one or more operators of a second plurality of at least partially manually operated vehicles operating within the first geographic area; and

program instructions to update at least one of the one or more operational rules, based at least in part on the data detailing the one or more reactions.

18. The computer system of claim 17, wherein the program instructions to collect data detailing one or more reactions comprises:

program instructions to detect one or more images of a facial expression; and

program instructions to analyze the one or more images of the facial expression to determine an operator response, wherein the analysis comprises performing facial expression recognition to determine a sentiment associated with the operator response.

19. The computer program product of claim 18, wherein the program instructions further comprise:

responsive to determining that the sentiment associated with the operator response is positive, program instructions to update the one or more operational rules to reflect the positive operator response to the deviation from the at least one of the one or more operational rules.

20. The computer program product of claim 18, wherein the program instructions further comprise:

responsive to determining that the driver response is negative, program instructions to update the one or more operational rules to reflect the negative operator response to the deviation from the at least one of the one or more operational rules.
